

Abstract of the Disclosure

An improved class of imaging devices with an ability to communicate, accept commands, change configuration parameters, and upgrade firmware/software via an embedded webserver are described. The improved imaging devices with an embedded webserver, allow the imaging devices to be managed, configured, and upgraded from a web browser via hypertext transfer protocol (HTTP). This presents a simple interface and protocol that has the added benefit of being available in most network environments and having browsers on many host platforms. Additionally, the improved imaging devices are adapted to find and/or upgrade other imaging devices on the network.
